

Fact Sheet 2: Glazing conservatory roofs

Superior quality glass and glazing options

When choosing your conservatory, the material you select for your roof glazing can make all the difference to all-year round enjoyment.

Considerations for glazing:

- Compared to polycarbonate, glass offers a much longer lifespan while traffic and rainfall noise are reduced by over 100%.
- The perfect glazing option should retain heat in the winter months and keep cool in the summer months, and with a minimum of UV rays getting through to precious furnishings.
- Using the very latest technology, the roof glass used by Altus combines solar reflection and thermal insulation, while reducing the damaging UV rays that can fade furnishings and fabrics.
- For conservatories in cooler areas or those that don't get a lot of direct sunlight, we can recommend thermal products that display solar control properties.
- Glare is reduced, your conservatory is warmer in winter and energy bills are lower.
- The glass Altus supplies features a self-clean coating so that dirt and grime are washed away taking the hassle out of keeping your conservatory or window glass clean.
- Our glass is available in four options, Climate Aqua HP, Climate Activ Blue, Climate Activ Neutral, and Climate Privacy.
- Now with the various options of glass your conservatory can be enjoyed whatever the weather, whatever the situation.

Express your individuality

We have a superb choice of traditional, contemporary and decorative glazing styles, allowing you to express your individuality whilst meeting your energy performance and budgetary needs. Our experienced design team will work with you to examine your requirements and choose the products that are exactly right for your project.
